

Clouds are made of water vapor.

When it is cold, rain turns to snow.

The warmth of the sun makes water evaporate.

Water vapor evaporates (transpires) into the air from plants and trees.

The same water goes around and around the earth in the water cycle.

Ground water seeps back to the surface to flow out.

Water freezes into ice and snow on mountains.

Water flows down rivers to the ocean.

Long ago dinosaurs may have drunk the same water we drink today.
